An example of pbadvise.asm is created, but not a working example, because it is missing the main function. Also the example does not open any files A: pbassem is an implementation of Pascal to assembler. It is used to produce static binary libraries. You should be able to extract the relevant files from the project. A steep and deep gully known as The Devil's Chimney runs past the south edge of Medicine Lake, Saskatchewan. This image was captured on September 5, 2016, at 1:18 PM local time

(12:18 UTC) by the Moderate Resolution Imaging Spectroradiometer (MODIS) on NASA's Terra satellite. Bright splotches of orange and yellow show where the sun's rays are reflected off plants growing in the gully. The bright purple-colored hue in the valley at the center of the image represents The Devil's Chimney, which is a technical term describing a steep and deep gully that cuts through Medicine Lake. It was named for the act of miners moving down the mountain with a rope attached to a pointed stick and holding on to the points of the stick when they encountered a sudden drop-off in the ground. When they dropped off, the miner would put his weight on the rope, which would hold them to the cliff. The gully features

PBasmUI

----- ' PBasmUI is a designed in order to offer you a simple interface for the PBcompiler to produce, edit and re-assemble the assembler file. The purpose of this interface is that the PBcompiler will use an interface so easy, as the ASM interface. It is less complex, therefore the user will have a more comfortable experience. This is the most comprehensive C program in order to see, how this will work. /* *

Introduction * * Start by making sure that your PATH variable is set to the path of the PB compiler on the system. * * Next you will want to run the compiler with the -x switch. This will give you a list of all the source files * that you are using with your program. * * You need to create a new file called b_ui.pas with only one 'unit' called: PBasmUI. * * Next put the following code in b_ui.pas in the unit called

```
PBasmUI: * program UIMenu; * * {$mode  
objfpc} * * uses * HPLOLIB, PSystem; * *  
{$R *.res} * procedure ShowMessageFn(N :  
LongWord; Msg: string); * function  
ToWideString(Input: string):string; * procedure  
Prompt(Prompt: string); * procedure EnableOK;  
* * implementation * end. * * When you are  
done building b_ui.pas you can save it, and run  
the PBcompiler. The first time you run the  
compiler you will * have to create a.ini file  
called config.ini. Put the following text into  
config.ini. Note this is only the first time you *  
run this file you will have to re-run the  
PBcompiler with the -x switch to see all the  
changes that you have made. * * {$I  
SR_HOME_DIR }/src/usr.ini
```
