The tool is very easy to use and it works like a charm. I hope the article will help others to understand better how to sync the sqlite databases in different computers. I had added SQLite data sync to my computer as the SQLite data sync is the same as the SQLite server. It is called SQLite data sync due to the fact that the tool is based on SQLite database files. It creates sqlite database on the local computer and copy all the data in sqlite database files. Information to the SQLite data sync : SQLite data sync is a software application you can use to synchronize data between your PC and a SQLite server, backed by a database. The tool allows you to move, copy, and synchronize data in your local database to a remote SQLite server. It works in either read-only or copy/update mode. The tool works as either the server or client. The server enables you to synchronize data between multiple local databases and SQLite servers. You can choose local databases as server, SQLite server as client, or a combination of both. The tool is free. You can add new local and SQLite servers by clicking on "Add server" button. It can be added by either (1) selecting "add SQLite server" or (2) adding a path to the SQLite database file. You can also copy an SQLite server by selecting "copy". You can also edit or delete existing servers by clicking on their names. Delete a server by clicking on its name. You can delete a server by selecting "delete server". Delete server would prompt for confirmation. You can synchronize data in local databases with SQLite servers by selecting "Synchronize servers". This would prompt for a server and local databases to synchronize. You can also add all the databases in a server by clicking on the server name. It would prompt for a database path.
